Cancer Burden

Cancer is a devastating disease. According to the American Cancer Society, in 2001 an estimated 553,400 Americans will die of cancer, and approximately 1.3 million new cancer cases will be diagnosed. These estimates do not include in situ (preinvasive) cancer of any site except urinary bladder or approximately 1 million cases of nonmelanoma skin cancer to be diagnosed this year. In Colorado, an estimated 14,300 new cancer cases will be diagnosed, and approximately 6,200 will die of this disease in 2001. Colorado ranks 49th highest overall in cancer mortality rates among the 50 states and Washington, D.C.*

The NPCR

Cancer surveillance involves the systematic collection, analysis, and use of cancer data. Information derived through surveillance is critical for directing effective cancer prevention and control programs. The Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR), authorized by Congress in 1992 through the Cancer Registries Amendment Act (Public Law 102-515), serves as the foundation of a national, comprehensive cancer control strategy. Statewide cancer registries provide critical data to help identify and monitor trends in cancer incidence and mortality over time; quide cancer control planning and evaluation;

help allocate health resources; and advance clinical, epidemiologic, and health services research.

Through the NPCR, CDC supports registries in 45 states, the District of Columbia, and three territories, representing 96% of the U.S. population.† Forty-five programs receive support to enhance existing registries; these have on-going cancer data-collection activities, policies and procedures for central registry operations in place, and core staff employed. Four programs receive support to plan and develop new registries; they are typically involved in laying the necessary groundwork for establishing a central, population-based registry.

With fiscal year 2001 appropriations of approximately \$36 million, CDC continues to support and enhance state cancer registries, and promotes appropriate uses of data. The CDC will also develop special research projects, such as studies of patterns of cancer care in specific populations and assessments of data for integration with geographic information systems.

State Highlights

- The Colorado Central Cancer Registry (CCCR) was certified by the North American Association of Central Cancer Registries for completeness, timeliness, and quality of its 1997 data.
- The CCCR has collaborated with the Colorado Foundation for Medical Care and the University of Colorado

Cancer Center to help assess the determinants of the use of various adjuvant treatment methods that are widely accepted as standard first-course treatment for stage I or II breast cancer with lumpectomy or stage III colon cancer with surgical resection. The study revealed that advancing age was the principal determinant of cases not receiving adjuvant therapies of radiotherapy for localized breast cancer after lumpectomy and chemotherapy for stage III colon cancer after resection.

 Another example of CCCR data use is a special National Institute of Occupational Safety and Health (NIOSH) project to conduct an epidemiological evaluation of cancer and occupational exposures at Rocky Flats. This project involves matching a Rocky Flats **Environmental Technology Site** Employee Roster of more than 20,000 current and former workers with Colorado Central Cancer Registry files to examine cancer risks from radiation doses and chemical exposures based on a variety of doses and exposure categories.
